

Swing Carriage

Swing Carriage - The load capacity of a forklift jib has a maximum of around 1935 pounds up to 6000 pounds on either the retracted or extended positions range. You may want to check with a material handling specialist about the specific restrictions of your lift truck use. The load capacity ratings are really meant for the jib itself and not the forklift or the maximum load which can be transferred safely making use of a particular lift truck. It is very important remember that at any time when any accessories like for example a lift truck jib are attached to the forklift, the new center of gravity created by the attachment will reduce the general lift capacity of the forklift. There are directions available which offer information on how to accurately gauge these load limits.

Before utilizing any forklift jib, be sure that the shackles and hooks are correctly secured to the forklift. Be sure and also double check that the pins are tight. It is very important that the weight calculations are correctly made and double checked. Remember to consider the truth that rated capacities occasionally decrease whenever the boom is in an elevated position, whenever the boom is extended with telehandlers or even whenever the mast is tilted frontward.

Some significant pointers regarding the modifiable jib are: don't ever pull a load making use of a forklift jib attachment, as these types of accessories are actually used for vertical lift only. At all times carry the load without letting it swing. Utilize extreme caution each and every time a load is lifted so as to prevent tipping over the truck.
